Technical sailing wear

TECHNICAL FEATURES

Imhoff shares your passion for sailing. We strive for perfection and we are constantly searching for the best quality and technical improvements with regard to materials and workmanship. We want you to enjoy the water and wind conditions to the extreme. That's why we make technical sailing wear which has the highest quality in terms of breathability and waterproofness. At Imhoff a basic jacket has more features than many top models of any other brand. Well considered and practical.

Breathability

Breathable materials allow moist produced by the body to pass the shell material but in return are fully waterproof. Breathable materials have been on the market for quite some time now, but the constant technical developments allow us to take breathability one step further. The latest Hi Tech materials have incredible breathable properties. Imhoff uses both 2 layer breathable materials such as VPR-10 as well as 3 layer extreme breathable materials such as VPR-20. Breathability is measured in litres per square meter per day. Our latest developed material VPR-20 has a breathability of 20ltr/m²/day.

Waterproofness

Waterproofness is something which is difficult to explain. A material is waterproof up to a certain water pressure. For Imhoff a material is waterproof if it can withstand a pressure of at least 5000 kg. per square meter, or 5 meter water column. Our VPR-20 material has a waterproofness of 20 meters water column.

Taped seams

All Imhoff jackets have taped seams. We use the best quality tapes available on the market today to make sure you stay absolutely dry.

Functional and comfortable

As a sailor you want to have optimal freedom of movement. During the design process this is already taken into account. Imhoff sailing jackets have pre-bent sleeves in all their sailing jackets. The quality of a sailing jacket depends partly on the quality of the accessories such as zippers and the used yarns. At Imhoff we only use the best quality. All sailing jackets and trousers have YKK zippers and full front Velcro to insure you will stay dry! Most models have fleece lined collars with integrated fluorescent multi-adjustable hoods. And some models have handwarmer pockets with detachable quick drying fleece lining.

Safety

Safety is an important issue on board sailing yachts. At Imhoff we take this issue very seriously. That is why all our jackets have integrated fluorescent hoods. The lining of all our jackets is open at the bottom hem to prevent water getting trapped should one fall overboard. All our jackets are fitted with loops to attach an automatic lifevest to the jacket.

Fit

At Imhoff we manufacture technical sailing wear for sailors. For men, women and kids. Most models are designed as unisex models. For the ladies we have a special shaped model. To keep the kids dry we developed a special collection jackets and sailing trousers for them too. Even for people with extra long legs or shorter legs, we have special sizes available in our collection.

Breathability

Breathability of all materials.

Male/female

Unisex models.

Waterproofness

Waterproofness of all materials.

Ladies

Ladies fit models.

Safety

Jackets and trousers have various safety features.

Kids

Sailing wear collection for kids.

Splashproof

Splashproof zippers.

Special sizes

Trousers with extra long/short legs.
MXL for extra long legs.
XLM for short legs.

Inner Phone pocket

MATERIALS

VPR-20 TRI-LAMINATE

VPR-20 consists of a wear-resistant polyamide shell with a hydrophilic membrane. The secret of the membrane is its molecular structure, which pulls sweat in, then pushed fluently to the outside through higher pressures and temperatures inside the clothing. This is a natural effect.

VPR-20 is a "smart-membrane": increased activity (heat inside the jacket) makes the molecules move faster, thus increasing breathability. VPR-20 is highly waterproof as the membrane has no holes to let water through.

Breathability: 20 liters/m²/day

Waterproofness: 20 meters watercolumn

VPR-10

VPR-10 is a unique material. Combining the advantages of micro-porous and hydrophilic coatings. Most manufacturers use a dry coating process, using hot air. This process creates the micro-pores required for breathability. However, breathability and waterproofness is still limited.

For VPR-10, we use a wet coating, then immerse the fabric in water, creating micro-pores while retaining hydrophobic properties. This results in a much higher breathability and waterproofness. In addition the process gives VPR-10 a much softer feel which increases wearing comfort.

Breathability: 10 liters/m²/day

Waterproofness: 10 meters watercolumn

VPR Lite

VPR Lite is an ultra-light shell material with a micro-porous coating on the inside. The coating is protected by a thin film with a decorative print.

Breathability: 5 liters/m²/day

Waterproofness: 5 meters watercolumn

DLX

DLX provides maximum comfort. Firstly, this fabric exhibits high resistance to water pressure to protect you against any adverse water conditions. The smart non-porous membrane stands for improved breathability, as it is capable of effectively controlling moisture permeability depending on the microclimate temperature inside the jacket. DLX features abrasion-resistant outer shell material. Our breathable waterproof products have taped seams to make them truly waterproof.

Breathability: 5 liters/m²/day

Waterproofness: 5 meters watercolumn

DLX Lite

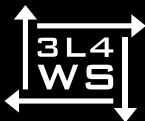

DLX Lite is a lightweight version of DLX. This material is 30% lighter in weight and ideal for use in warmer climates.

Breathability: 5 liters/m²/day

Waterproofness: 5 meters watercolumn

3L4WS

Water transfers heat much faster than air. To stay warm, you must stay dry, and wear clothing that transports body moisture away from your skin. A 3-layer clothing system contains a base layer specially designed to quickly wick moisture away from the skin toward the middle clothing layer. The middle layer is the main insulation layer. Imhoff's new 3L4WS material was developed specifically for mid-layer purposes. The outer shell stretches in 4 directions and its smooth surface reduces friction between the layers for excellent freedom of movement. On the inside this 3-layer material features comfortable non-pilling microfleece, removing moisture to the outer layer and providing thermal insulation. A breathable membrane connects the two layers.

ISOTHERM MICRO FLEECE

Fleece is usually made from PET (plastic bottles), which does not absorb water and holds air: highly insulating, perfect in cold dry climates. It is important to have a midlayer that can temporarily absorb moist from the skin or base layer and which transfers this to the outer shell where it evaporates. Imhoff's Isotherm Micro fleece is made of moisture-absorbing fibres which, like miniature water pumps, transport moisture away from the body for a dry, warm, comfortable feeling. Isotherm Micro fleece is a soft, lightweight fabric that does not pill.

DSX Lite

We developed a new material which fulfils all requirements to keep children warm and dry during sailing. For this product we used the much appreciated Breathable DSX Lite outer shell material in combination with a breathable lining.

Breathability: 3 liters/m²/day

Waterproofness: 3 meters watercolumn

CATEGORIES

Offshore

The **long distance** sailor who wants to stay warm and dry in the most **extreme conditions**, needs the **Imhoff Offshore** collection.

Performance

The **active sailor** who expects the maximum **performance** will find this in our specially designed **Imhoff Performance** collection.

Coastal

Sailors of **coastal waters** will find their match in the **Imhoff Coastal** collection.

Inshore

The **Inshore collection** is a good choice if lakes, estuary's or other **sheltered waters** are your sailing area. Our **Inshore collection** will give all the comfort you need regarding waterproofness and breathability.

COLLECTION
